Quantstamp Security Assessment Certificate

September 7th 2022 — Quantstamp Verified

Lukso LSPs

This audit report was prepared by Quantstamp, the leader in blockchain security.

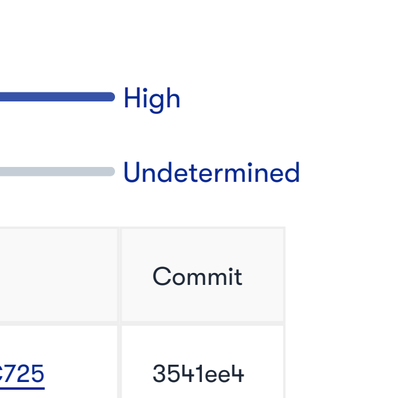
Executive Summary

Type	Industry Standards for Universal Profile and Asset Contracts
Auditors	Poming Lee, Senior Research Engineer Bohan Zhang, Auditing Engineer Rabib Islam, Research Engineer
Timeline	2022-07-11 through 2022-09-08
EVM	Gray Glacier
Languages	Solidity
Methods	Architecture Review, Unit Testing, Functional Testing, Computer-Aided Verification, Manual Review
Specification	Public Facing Documents LSP standards
Documentation Quality	High
Test Quality	Undetermined

Source Code

Repository	Commit
ERC725Alliance/ERC725	3541ee4
lukso-network/lsp-smart-contracts	602b79b
ERC725Alliance/ERC725	5c47854
lukso-network/lsp-smart-contracts	3f14866

Total Issues	**14** (8 Resolved)
High Risk Issues	0 (0 Resolved)
Medium Risk Issues	0 (0 Resolved)
Low Risk Issues	**6** (5 Resolved)
Informational Risk Issues	**8** (3 Resolved)
Undetermined Risk Issues	0 (0 Resolved)



High Risk	The issue puts a large number of users' sensitive information at risk, or is reasonably likely to lead to catastrophic impact for client's reputation or serious financial implications for client and users.
Medium Risk	The issue puts a subset of users' sensitive information at risk, would be detrimental for the client's reputation if exploited, or is reasonably likely to lead to moderate financial impact.
Low Risk	The risk is relatively small and could not be exploited on a recurring basis, or is a risk that the client has indicated is low-impact in view of the client's business circumstances.
Informational	The issue does not post an immediate risk, but is relevant to security best practices or Defence in Depth.
Undetermined	The impact of the issue is uncertain.
Unresolved	Acknowledged the existence of the risk, and decided to accept it without engaging in special efforts to control it.
Acknowledged	The issue remains in the code but is a result of an intentional business or design decision. As such, it is supposed to be addressed outside the programmatic means, such as: 1) comments, documentation, README, FAQ; 2) business processes; 3) analyses showing that the issue shall have no negative consequences in practice (e.g., gas analysis, deployment settings).
Fixed	Adjusted program implementation, requirements or constraints to eliminate the risk.
Mitigated	Implemented actions to minimize the impact or likelihood of the risk.

Summary of Findings

Quantstamp has done the audit for Lukso's LSPs, on a best-effort basis, with 3 auditors working independently (based on a commit-reveal scheme and later on syncing on their findings). During the course of this audit, we have found a few issues with low and informational severity levels. Overall, the code and the documentation appear to be of high quality; however, the coverage score of the test suite cannot be determined at this moment due to the testing framework used. The dev team has been very professional and helpful throughout the course of the audit. Although we have discovered some issues that may be fixed before the project goes live, we believe that the project may remain risky in the sense that as an industry standard, the project is novel, contains intricate logic, and is expected to be extensively applied to a wide variety of user scenarios with/without being modified by different developers from other projects. Unexpected new ways of using the standards may arise and edge cases are extremely difficult to predict. We highly recommend extensively testing the code (at least improving all coverage to >90%) and thinking of more edge cases before going live. Also, continuous on-chain observation and revision of the standards based on how people/projects are using them are recommended.

2022-09-08 Update: During this re-audit, the admin team has brought all the status of findings into fixed, acknowledged, or mitigated. The coverage scores have been obtained. At this moment the branch coverage for `ERC725Alliance/ERC725` is 88.1% and 82.23% for `lukso-network/lsp-smart-contracts`.

ID	Description	Severity	Status
QSP-1	Overwriting without User Acknowledgement Due to Hash Collision/Mistake	Low	Acknowledged
QSP-2	Operator Could Clear Operator List	Low	Fixed
QSP-3	Missing Input Validation	Low	Fixed
QSP-4	Missing `_disableInitializers` for some Contracts	Low	Fixed
QSP-5	`LSP6KeyManagerCore::_countTrailingZeroBytes()` Can Not Recognize the Condition Where `key == 0`	Low	Fixed
QSP-6	Incorrect Key Prefix Could Be Used	Low	Fixed
QSP-7	Critical Functions Are Not Protected From Reentrancy	Informational	Acknowledged
QSP-8	On Potential Hash Collisions	Informational	Acknowledged
QSP-9	Allowance Double-Spend Exploit	Informational	Acknowledged
QSP-10	Repeatedly Adding the Same Operator for One TokenID	Informational	Fixed
QSP-11	Unlocked Pragma	Informational	Acknowledged
QSP-12	Possible to Renounce Ownership	Informational	Mitigated
QSP-13	`LSP1UniversalReceiver` Can Lead to Unexpected Reentrancy Behavior	Informational	Acknowledged
QSP-14	Remove Non-Existing Operator	Informational	Fixed

Quantstamp Audit Breakdown

Quantstamp's objective was to evaluate the repository for security-related issues, code quality, and adherence to specification and best practices.

DISCLAIMER:
If the final commit hash provided by the client contains features that are not in scope of the audit or a re-audit, those features are excluded from consideration in this report.

Possible issues we looked for included (but are not limited to):

- Transaction-ordering dependence
- Timestamp dependence
- Mishandled exceptions and call stack limits
- Unsafe external calls
- Integer overflow / underflow
- Number rounding errors
- Reentrancy and cross-function vulnerabilities
- Denial of service / logical oversights
- Access control
- Centralization of power
- Business logic contradicting the specification
- Code clones, functionality duplication
- Gas usage
- Arbitrary token minting

Methodology

The Quantstamp auditing process follows a routine series of steps:

1. Code review that includes the following
   i. Review of the specifications, sources, and instructions provided to Quantstamp to make sure we understand the size, scope, and functionality of the smart contract.
   ii. Manual review of code, which is the process of reading source code line-by-line in an attempt to identify potential vulnerabilities.
   iii. Comparison to specification, which is the process of checking whether the code does what the specifications, sources, and instructions provided to Quantstamp describe.
2. Testing and automated analysis that includes the following:
   i. Test coverage analysis, which is the process of determining whether the test cases are actually covering the code and how much code is exercised when we run those test cases.
   ii. Symbolic execution, which is analyzing a program to determine what inputs cause each part of a program to execute.
3. Best practices review, which is a review of the smart contracts to improve efficiency, effectiveness, clarify, maintainability, security, and control based on the established industry and academic practices, recommendations, and research.
4. Specific, itemized, and actionable recommendations to help you take steps to secure your smart contracts.

Toolset

The notes below outline the setup and steps performed in the process of this audit.

Setup

Tool Setup:

- Slither v0.8.2

Steps taken to run the tools:

1. Install the Slither tool: `pip3 install slither-analyzer`
2. Run Slither from the project directory: `slither .`

Findings

QSP-1 Overwriting without User Acknowledgement Due to Hash Collision/Mistake

Severity: *Low Risk*

Status: Acknowledged

File(s) affected: `ERC725-3541ee4/implementations/contracts/ERC725YCore.sol`

Description: Users may call `setData()` with an existing key by mistake or because of a hash collision. As the core part of this project. It is suggested to distinguish two modes, one of which sets new data, while the other modifies existing data.

Recommendation: Consider adding relative checks when calling `ERC725YCore::_setData()`. For instance, by adding a `boolean` to API representing if users allow an overwritten.

Update: The dev team stated:

```
ERC725Y is a general module that allows mapping data keys to data values. These data keys are not checked by default if they are mapped to some data value or not.
To check if a data key is mapped to some value or not before writing is seen as an optional feature for some users implementing the ERC725Y standard. This design decision is also supported by the additional gas cost that
would be required to read the contract storage to check for overriding or not.
If a check should be added to avoid overwriting existing entries, it should be added on the LSP6KeyManager standard instead of on LSP0. An issue was opened on the LIPs repo to discuss splitting SETDATA Permission into
```

```
EDITDATA and ADDDATA Permissions.
See [issue #110](https://github.com/lukso-network/LIPs/issues/110) in lukso-network/LIPs repository.
```

QSP-2 Operator Could Clear Operator List

Severity: *Low Risk*

Status: Fixed

File(s) affected: `lsp-smart-contracts-602b79b/contracts/LSP8IdentifiableDigitalAsset/LSP8IdentifiableDigitalAssetCore.sol`

Description: For the function `revokeOperator()`, the dev team only allows the token owner to revoke the operator. However, if any operator calls `transfer(from = owner, to = owner)`, then the operator list is cleared, and the owner will still have the NFT. The effect would be equivalent to that the operator successfully revokes all operators.

Recommendation: Re-consider whether this behavior is allowed from the standards' perspective. Otherwise, add relevant checks to stop this unexpected edge case from occurring.

Update: The dev team stated:

```
A custom error in LSP8 was introduced to revert when the from and to addresses are the same, to avoid this unexpected side effect of clearing the list of operators for a specific tokenId.
See [PR #266](https://github.com/lukso-network/lsp-smart-contracts/pull/266) in lukso-network/lsp-smart-contracts repository.
```

QSP-3 Missing Input Validation

Severity: *Low Risk*

Status: Fixed

File(s) affected: `lsp-smart-contracts-602b79b/contracts/Custom/ClaimOwnership.sol`

Description: To avoid human error, it is important to validate inputs even if they only come from trusted addresses. The following functions do not have a proper validation of input parameters:

1. `lsp-smart-contracts-602b79b/contracts/Custom/ClaimOwnership.sol::transferOwnership()` does not check if `newOwner` is `0x0`.
2. `lsp-smart-contracts-602b79b/contracts/LSP4DigitalAssetMetadata/LSP4DigitalAssetMetadata.sol::constructor()` does not check if `newOwner_` is `0x0`.
3. `lsp-smart-contracts-602b79b/contracts/LSP8IdentifiableDigitalAsset/LSP8IdentifiableDigitalAssetCore.sol::_burn()` does not check if the NFT token it wants to burn exists or not.

Recommendation: Consider adding relevant checks.

Update: The dev team stated:

```
Regarding the missing input validations, below are the details of actions taken on each points.

1.    lsp-smart-contracts-602b79b/contracts/Custom/ClaimOwnership.sol::transferOwnership() does not check if newOwner is 0x0.

Not implemented in the ClaimOwnership contract as in some cases, transferring ownership to the address(0) can be relevant. Examples:
-    to reset the pendingOwner to address(0) if the owner made a mistake in the address provided as a parameter.
-    if the owner changes his mind and does not want to transfer ownership anymore.

2.    lsp-smart-contracts-602b79b/contracts/LSP4DigitalAssetMetadata/LSP4DigitalAssetMetadata.sol::constructor() does not check if newOwner_ is 0x0.

Fixed and implemented directly in:
-    LSP4DigitalAssetMetadata.sol and LSP4DigitalAssetMetadataInitAbstract.sol: [PR #268](https://github.com/lukso-network/lsp-smart-contracts/pull/268) on lukso-network/lsp-smart-contracts repository.
-    ERC725, ERC725InitAbstract, ERC725X, ERC725XInitAbstract, ERC725Y and ERC725YInitAbstract: [PR #159](https://github.com/ERC725Alliance/ERC725/pull/159) in ERC725Alliance/ERC725 repository.

A new 3.1.3 version of the @erc725/smart-contracts package will be released and the dependency will be upgraded in the @lukso/lsp-smart-contracts repository to ensure that this requirement check is fixed on all the LSP smart
contracts implementations that inherit from any ERC725 contracts.

3.    lsp-smart-contracts-602b79b/contracts/LSP8IdentifiableDigitalAsset/LSP8IdentifiableDigitalAssetCore.sol::_burn() does not check if the NFT token it wants to burn exists or not.

Not applicable: the internal _burn(...) function checks if the tokenId passed as a parameter exists through the function tokenOwnerOf(...). See [LSP8DigitalAssetCore.sol, line 307](https://github.com/lukso-network/lsp-smart-
contracts/blob/4576e9dd6bf7597ac06d8036a19e817cc35611c7/contracts/LSP8IdentifiableDigitalAsset/LSP8IdentifiableDigitalAssetCore.sol#L307) and [LSP8DigitalAssetCore.sol, lines 69-71](https://github.com/lukso-network/lsp-
smart-contracts/blob/4576e9dd6bf7597ac06d8036a19e817cc35611c7/contracts/LSP8IdentifiableDigitalAsset/LSP8IdentifiableDigitalAssetCore.sol#L69-L71).
More tests were added in commit 4576e9d ([PR #268](https://github.com/lukso-network/lsp-smart-contracts/pull/268)) to ensure that the _burn(...) function reverts when the tokenId given as a parameter does not exist.
```

QSP-4 Missing `_disableInitializers` for some Contracts

Severity: *Low Risk*

Status: Fixed

File(s) affected: `lsp-smart-contracts-602b79b/contracts/LSP4DigitalAssetMetadata/LSP4DigitalAssetMetadataInit.sol`, `lsp-smart-contracts-602b79b/contracts/LSP7DigitalAsset/extensions/LSP7CappedSupplyInit.sol`, `lsp-smart-contracts-602b79b/contracts/LSP7DigitalAsset/presets/LSP7CompatibleERC20MintableInit.sol`, `lsp-smart-contracts-602b79b/contracts/LSP8IdentifiableDigitalAsset/extensions/LSP8CompatibleERC721Init.sol`, `lsp-smart-contracts-602b79b/contracts/LSP8IdentifiableDigitalAsset/presets/LSP8CompatibleERC721MintableInit.sol`, `lsp-smart-contracts-602b79b/contracts/LSP8IdentifiableDigitalAsset/extensions/LSP8CappedSupplyInit.sol`

Description: An uninitialized contract can be taken over by an attacker. This applies to both a proxy and its implementation contract, which may impact the proxy. To prevent the implementation contract from being used, you should invoke the `_disableInitializers` function in the constructor to automatically lock it when it is deployed.
The following contracts' `constructor` is not protected by `_disableInitializers`:

1. `LSP4DigitalAssetMetadataInit`
2. `LSP7CappedSupplyInit`
3. `LSP7CompatibleERC20MintableInit`
4. `LSP8CompatibleERC721Init`
5. `LSP8CompatibleERC721MintableInit`
6. `LSP8CappedSupplyInit`

Recommendation: Consider adding `_disableInitializers` to the `constructor` of the listed contracts to enhance security.

Update: The dev team stated:

```
The following changes were applied to resolve this issue:
```

```
-    A constructor with a call to _disableInitializers(...) was added in the following contracts
    -   LSP7CompatibleERC20MintableInit
    -   LSP8CompatibleERC721MintableInit

-    The following contracts from the extensions/ folder of LSP7 and LSP8 were removed.
    -   LSP4DigitalAssetMetadataInit
    -   LSP7CappedSupplyInit
    -   LSP8CappedSupplyInit
    -   LSP7CompatibleERC20Init
    -   LSP8CompatibleERC721Init

These contracts are token extension and should be used via inheritance, not deployed directly. The inheritance of other contracts was changed to use the InitAbstract contracts in replacement.
See [PR #265](https://github.com/lukso-network/lsp-smart-contracts/pull/265) in lukso-network/lsp-smart-contracts repository:
```

QSP-5 `LSP6KeyManagerCore::_countTrailingZeroBytes()` Can Not Recognize the Condition Where `key == 0`

Severity: *Low Risk*

Status: Fixed

File(s) affected: `lsp-smart-contracts-602b79b/contracts/LSP6KeyManager/LSP6KeyManagerCore.sol`

Description: On `lsp-smart-contracts-602b79b/contracts/LSP6KeyManager/LSP6KeyManagerCore.sol::L616`, the minimum `index` is `0`, so the max value of the function output result would be `31` instead of `32`.

Recommendation: Consider changing the while loop condition into `while (index >= 0 && key[index] == 0x00) index--;` to fix this edge case.

Update: The dev team stated:

```
This issue was found by the internal smart contract team during the audit. There was an underflow in the function _countTrailingZeroBytes(...) if one of the allowed ERC725Y Keys in the list was bytes32(0).

See [PR #226](https://github.com/lukso-network/lsp-smart-contracts/pull/226) in lukso-network/lsp-smart-contracts where the issue was initially resolved.

An extra bug was also found in the same function. The index in the while loop was checked incorrectly. The function was refactored with more tests were added to ensure the correct behaviour (for instance, when an allowed
ERC725Y contains only 1 bytes, and 31 trailing zero bytes).

See [PR #264](https://github.com/lukso-network/lsp-smart-contracts/pull/264) in lukso-network/lsp-smart-contracts.
```

QSP-6 Incorrect Key Prefix Could Be Used

Severity: *Low Risk*

Status: Fixed

File(s) affected: `lsp-smart-contracts-602b79b/contracts/LSP2ERC725YJSONSchema/LSP2Utils.sol`

Description: According to the documentation, data keys of type "Mapping" and "MappingWithGrouping" are formatted such that there are two empty bytes between the first ten bytes and the last twenty bytes. However, the versions of the functions `generateMappingKey` and `generateMappingWithGroupingKey` that use byte inputs take `bytes12` for the first part of the key without ensuring that there are two empty bytes as per the specification.

Recommendation: Consider making the functions take `bytes10` for the first argument, and while generating the data key, make sure to concatenate two empty bytes in the middle of the key.

Update: The dev team stated:

```
All the literal constants for LSP2 key types Mapping and MappingWithGrouping were edited to remove the last two zero bytes. Both functions were refactored as per the suggested changes to append two zero bytes at the end.

See [PR #269](https://github.com/lukso-network/lsp-smart-contracts/pull/269/files) in lukso-network/lsp-smart-contracts.
```

QSP-7 Critical Functions Are Not Protected From Reentrancy

Severity: *Informational*

Status: Acknowledged

File(s) affected: `ERC725-3541ee4/implementations/contracts/ERC725XCore.sol`, `lsp-smart-contracts-602b79b/contracts/LSP0ERC725Account/LSP0ERC725AccountCore.sol`, `lsp-smart-contracts-602b79b/contracts/LSP6KeyManager/LSP6KeyManagerCore.sol`, `lsp-smart-contracts-602b79b/contracts/LSP7DigitalAsset/LSP7DigitalAssetCore.sol`, `lsp-smart-contracts-602b79b/contracts/LSP8IdentifiableDigitalAsset/LSP8IdentifiableDigitalAssetCore.sol`, `lsp-smart-contracts-602b79b/contracts/LSP9Vault/LSP9VaultCore.sol`

Description: There are several critical functions in the system that are not protected from re-entrancy and this pattern could be used as a tool to conduct a complex attack that involves re-entrancy attack.

1. `ERC725XCore::execute()`
2. `LSP0ERC725AccountCore::universalReceiver()`
3. `LSP6KeyManagerCore::executeRelayCall()`
4. `LSP6KeyManagerCore::execute()`
5. `LSP7DigitalAssetCore.sol::_transfer()`
6. `LSP7DigitalAssetCore.sol::_mint()`
7. `LSP7DigitalAssetCore.sol::_burn()`
8. `LSP8IdentifiableDigitalAssetCore::_transfer()`
9. `LSP8IdentifiableDigitalAssetCore::_mint()`
10. `LSP8IdentifiableDigitalAssetCore::_burn()`
11. `LSP9VaultCore::universalReceiver()`

Recommendation: It is highly recommended to inherit (ReentrancyGuard.sol)[https://github.com/OpenZeppelin/openzeppelin-contracts/blob/master/contracts/security/ReentrancyGuard.sol] and add `nonReentrant` modifier to all the critical functions that are not expected to be re-entered.

Update: The dev team stated:

```
1.    ERC725XCore::execute(): Will NOT receive an reentrancy guard, as its a core module, to be used in a variety of contracts. Reentrancy is a feature here.
```

```
2.    LSP0ERC725AccountCore::universalReceiver(): Will NOT receive an reentrancy guard, as its a feature to notify the UP of multiple actions that happen during a transaction. For example sending of batch transactions via a LSP7/8 transferBatch() call.
3.    LSP6KeyManagerCore::executeRelayCall()
LSP6KeyManagerCore::execute(): Will ADD an reentrancy guard in the current implementation, to keep the risk smaller. With the goal to remove it in the future, when risks and use cases are better understood, as reentrancy is a feature for potential use cases here, and the KM safeguards entrance based on permission.
4.    LSP7DigitalAssetCore.sol::_transfer(): Will NOT receive an reentrancy guard as its a feature for protocols and its protected as the msg.sender needs to have a balance.
5.    LSP7DigitalAssetCore.sol::_mint(): Will NOT receive an reentrancy guard on the internal function, its a feature for protocols and its protected as the msg.sender is the owner in the public mint(...) function of the preset contracts.
6.    LSP7DigitalAssetCore.sol::_burn(): Will NOT receive an reentrancy guard on the internal function, its a feature for protocols and its protected as the msg.sender is the owner.
7.    LSP8IdentifiableDigitalAssetCore::_transfer(): Will NOT receive an reentrancy guard as its a feature for protocols and its protected as the msg.sender needs to have a balance.
8.    LSP8IdentifiableDigitalAssetCore::_mint(): Will NOT receive a reentrancy guard on the internal function, its a feature for protocols and its protected as the msg.sender is the owner in the public mint(...) function of the preset contracts.
9.    LSP8IdentifiableDigitalAssetCore::_burn(): Will NOT receive an reentrancy guard on the internal function, its a feature for protocols and its protected as the msg.sender is the owner.
10.    LSP9VaultCore::universalReceiver(): Will NOT receive an reentrancy guard, as its a feature to notify the Vault of multiple actions that happen during a transaction. For example sending of batch transactions via a LSP7/8 transferBatch() call.
See [issue #286](https://github.com/lukso-network/lsp-smart-contracts/issues/286) in lukso-network/lsp-smart-contracts repository.
```

Notably, point (3) has not been added to the code base at this moment when we do the fix review.

QSP-8 On Potential Hash Collisions

Severity: *Informational*

Status: Acknowledged

File(s) affected: `lsp-smart-contracts-602b79b/contracts/LSP2ERC725YJSONSchema/LSP2Utils.sol`

Description: In the function `generateMappingWithGroupingKey(firstWord, secondWord, addr)`, when `firstword` and `addr` are the same, there is a `0.0000000233%` possibility that two random variables `secondWord` will result in the same key.

Recommendation: Consider adding this information to the public-facing documentation to make sure that users and devs working on related projects are aware of this risk and would be taking action to avoid it. Another approach to prevent this collision from happening is to explicitly reject the condition where `firstWord == addr`.

Update: The dev team stated:

```
A warning of potential hash collision for LSP2 key type MappingWithGrouping was documented in docs.lukso.tech (Standards > Generic Standards > LSP2 > MappingWithGrouping.

See [PR #369](https://github.com/lukso-network/docs/pull/369) in lukso-network/docs.
```

QSP-9 Allowance Double-Spend Exploit

Severity: *Informational*

Status: Acknowledged

File(s) affected: `lsp-smart-contracts-602b79b/contracts/LSP7DigitalAsset/LSP7DigitalAssetCore.sol`

Description: As it presently is constructed, the contract is vulnerable to the allowance double-spend exploit, as with other ERC20/LSP7 tokens.

Exploit Scenario:

1. Alice allows Bob to transfer `N` amount of Alice's tokens (`N>0`) by calling the `authorizeOperator()` method on `Token` smart contract (passing Bob's address and `N` as method arguments)
2. After some time, Alice decides to change from `N` to `M` (`M>0`) the number of Alice's tokens Bob is allowed to transfer, so she calls the `authorizeOperator()` method again, this time passing Bob's address and `M` as method arguments
3. Bob notices Alice's second transaction before it was mined and quickly sends another transaction that calls the `transfer()` method to transfer `N` Alice's tokens somewhere
4. If Bob's transaction will be executed before Alice's transaction, then Bob will successfully transfer `N` Alice's tokens and will gain the ability to transfer another `M` tokens
5. Before Alice notices any irregularities, Bob calls the`transfer()` method again, this time to transfer `M` Alice's tokens.

Recommendation: The exploit (as described above) can be mitigated through the use of functions that increase/decrease the allowance relative to its current value, such as `increaseAllowance()` and `decreaseAllowance()`.
Pending community agreement on an ERC standard that would protect against this exploit, we recommend that developers of applications dependent on a traditional `approve()` / `transferFrom()` should keep in mind that they have to set allowance to `0` first and verify if it was used before setting the new value. Teams who decide to wait for such a standard should make these recommendations to app developers who work with their token contracts.

Update: The dev team stated:

```
As a secure flow exists due to setting the allowance to 0 and the setting it to the wanted number, we don't see a strong need for extra functions in the standard.
We will discuss in the future within the community if it makes sense to add two new functions to the standard.

-    [PR #111](https://github.com/lukso-network/LIPs/pull/111) in lukso-network/LIP repository
```

QSP-10 Repeatedly Adding the Same Operator for One TokenID

Severity: *Informational*

Status: Fixed

File(s) affected: `lsp-smart-contracts-602b79b/contracts/LSP8IdentifiableDigitalAsset/LSP8IdentifiableDigitalAssetCore.sol`

Description: Users can call the function `authorizeOperator()`, multiple times with the same arguments. That will also cause the same event to be emitted multiple times.

Recommendation: Consider checking the returned `boolean` of `EnumerableSet::add()` in `authorizeOperator()`.

Update: The dev team stated:

```
The function authorizeOperator(...) in LSP8 was refactored to revert when an operator for a specific tokenId is already approved.

See [PR #270](https://github.com/lukso-network/lsp-smart-contracts/pull/270) in lukso-network/lsp-smart-contracts
```

QSP-11 Unlocked Pragma

Severity: *Informational*

Status: Acknowledged

File(s) affected: `ERC725-3541ee4/*,lsp-smart-contracts-602b79b/*`

Description: Every Solidity file specifies in the header a version number of the format pragma solidity (^)0.8.*. The caret (^) before the version number implies an unlocked pragma, meaning that the compiler will use the specified version and above, hence the term "unlocked".

Recommendation: For consistency and to prevent unexpected behavior in the future, it is recommended to remove the caret to lock the file onto a specific Solidity version.

Update: The dev team stated:

```
The SWC-103 (Smart Contract Weakness Classification nb 103) mentions:

“Pragma statements can be allowed to float when a contract is intended for consumption by other developers, as in the case with contracts in a library or EthPM package. Otherwise, the developer would need to manually update the pragma in order to compile locally.”

This is the case of the lsp-smart-contracts. These contracts are intended to be used as a library and consumed by other developers. Therefore, a floating pragma was kept on all the contracts.

See [PR #275](https://github.com/lukso-network/lsp-smart-contracts/pull/275) in lukso-network/lsp-smart-contracts repository.
```

QSP-12 Possible to Renounce Ownership

Severity: *Informational*

Status: Mitigated

File(s) affected: `ERC725-3541ee4/implementations/contracts/custom/OwnableUnset.sol`

Description: Contract `OwnableUnset` contains the function `renounceOwnership`, which, if called, would render the contract largely unusable. In particular, it would leave an `LSP0ERC725Account` without `KeyManager`, resulting in much of the contracts' functionality being unusable. This could lead to loss of funds and in some cases break composability where the contract in concern is part of a greater system of contracts.

Recommendation: Override the `renounceOwnership` function in contracts that should not be left without an owner.

Update: The dev team stated:

```
RenounceOwnership is a valid use case when UP owners die, or NFTs should be finally locked.

-    In ERC725 contracts RenounceOwnership is left in its basic form, as those are module contracts for a variety of other smart contracts.

-    For LSP0 and LSP9 we changed it now to two step process, where the the user calls renounceOwnership(), which starts a time in blocks, where for the first 100 blocks, he can not complete the renouncement, and after 100 blocks he has the ability to call renounceOwnership() again to complete the renouncement. If after 200 blocks after the initial call to renounceOwnership() the process was not completed, the user will have to start all over again.
We also added a RenounceOwnershipInitiated Event to notify the user of a started process.

This will allow for a delay time for the owner to act, if a malicious controller initiated the process. And allows for an expiry, the process is not completed within 100 blocks (~20min)

-    The LSP6 implementation will not allow renounceOwnership(...) at all for now.

See the following references for more details:
-    [Issue #115](https://github.com/lukso-network/LIPs/issues/115) in lukso-network/LIPs.
-    [PR #282](https://github.com/lukso-network/lsp-smart-contracts/pull/282) in lukso-network/lsp-smart-contracts.
```

QSP-13 `LSP1UniversalReceiver` Can Lead to Unexpected Reentrancy Behavior

Severity: *Informational*

Status: Acknowledged

Description: In scenarios where permissions are set in certain specific ways, users may trigger transactions that cause their balances to change much more drastically than expected. Consider the following scenario:

1. Alice authorizes Bob as an operator for `5000` tokens.
2. Bob uses a universal receiver with logic that calls `transfer` using the sender's funds to send the remainder of the sender's balance to himself.
3. Alice transfers `200` tokens to Bob.
4. Bob receives `5000` tokens, more than Alice expected.

Although Alice did authorize Bob to transfer her tokens as she saw fit, she did not expect that merely transferring `200` tokens would wipe out her entire balance.

Recommendation: Properly notify users of the potential for unexpected behavior due to `universalReceiver` when functions like `authorizeOperator` are called.

Update: The dev team stated:

```
We introduced a warning in the LSP7 and LSP8 pages on docs.lukso.tech.

Regarding the example documented in the audit report, we do not consider this as a security issue in this context. Since Bob was granted an operator allowance in the first place by Alice, he could also transfer all the tokens to himself in a separate transaction.

It should be up to the LSP7 token contract implementation to decide if this behaviour should be allowed or not by adding a reentrancy guard on the transfer(...) function. It is something to not restrict on the standard level or the implementation.

Since the LSP1UniversalReceiverDelegate is the only gateway for users to react depending on the action they get notified about (token transfers, etc.), there could be use cases where the universalReceiver(...) function should be reentered to perform specific actions.

A notice was added in docs.lukso.tech about external calls being done via hooks when LSP7 and LSP8 assets are transferred.

See [PR #376](https://github.com/lukso-network/docs/pull/376) in lukso-network/docs repository for more details.
```

QSP-14 Remove Non-Existing Operator

Severity: *Informational*

Status: Fixed

File(s) affected: `lsp-smart-contracts-602b79b/contracts/LSP8IdentifiableDigitalAsset/LSP8IdentifiableDigitalAssetCore.sol`

Description: When the user calls `_revokeOperator()` with a non-existing operator, the function will terminate successfully and with an incorrectly emitted event.

Recommendation: Consider checking the returned `boolean` of `EnumerableSet::add()` in `_revokeOperator()`.

Update: The dev team stated:

```
The function revokeOperator(...) in LSP8 now revert when the caller tries to revoke an operator that does not exist, or is not authorised as an operator for a specific tokenId.

See [PR #271](https://github.com/lukso-network/lsp-smart-contracts/pull/271) in lukso-network/lsp-smart-contracts repository.
```

Automated Analyses

Slither

Slither reported `587` results, all of which were either identified as false positives or included in the findings of this report.

Code Documentation

1. claimownership: a typo "In EIP713", should be "In EIP173" instead.
2. On `L140`, `L157`, and `L177` of `ERC725-3541ee4/implementations/contracts/ERC725XCore.sol`, "Unknow Error" should be "Unknown Error"
3. On `L107`, `L148` of `lsp-smart-contracts-602b79b/contracts/LSP6KeyManager/LSP6KeyManagerCore.sol`, "Unknow Error" should be "Unknown Error"
4. On `L145` of `lsp-smart-contracts-602b79b/contracts/LSP5ReceivedAssets/LSP5Utils.sol`, "elemnt" should be "element"
5. `lsp-smart-contracts-602b79b/contracts/LSP6KeyManager/ILSP6KeyManager.sol::L36`: `_calldata` -> `payload`
6. `lsp-smart-contracts-602b79b/contracts/LSP2ERC725YJSONSchema/LSP2Utils.sol`: Not every function has NatSpec.
7. In LSP6: "they check on restrictions for addresses, standards, or functions are skipped." is improper grammar.
8. In LSP6: similarly, "This allows for cheaper transactions where, these restrictions aren't set anyway."
9. In LSP6: sequentiel -> sequential
10. In LSP6: sequentielially -> sequentially
11. singleton, the "key" inside the example JSON:

```
{
  "name": "SupportedStandards:LSP3UniversalProfile",
  "key": "0xeafec4d89fa9619884b6b89135626455000000000000000000000000abe425d6",
  "keyType": "Mapping",
  "valueType": "bytes4",
  "valueContent": "0xabe425d6"
}
```

is different from the key listed in the image. Please check which one is correct.

======2022-09-08 Update: all fixed======

Adherence to Best Practices

1. [fixed] TODO on `lsp-smart-contracts-602b79b/contracts/Factories/UniversalFactory.sol::L135`.
2. [fixed] TODO on `lsp-smart-contracts-602b79b/contracts/LSP0ERC725Account/LSP0ERC725AccountCore.sol::L60`.
3. [fixed] TODO on `lsp-smart-contracts-602b79b/contracts/LSP1UniversalReceiver/LSP1UniversalReceiverDelegateUP/LSP1UniversalReceiverDelegateUP.sol::L63`
4. [fixed] TODO on `lsp-smart-contracts-602b79b/contracts/LSP6KeyManager/LSP6KeyManagerCore.sol::L453`
5. [fixed] TODO on `lsp-smart-contracts-602b79b/contracts/LSP6KeyManager/LSP6KeyManagerCore.sol::L644`
6. [fixed] TODO on `lsp-smart-contracts-602b79b/contracts/LSP8IdentifiableDigitalAsset/LSP8IdentifiableDigitalAssetCore.sol::L229`
7. [ack] Functions `_mint` in `lsp-smart-contracts-602b79b/contracts/LSP7DigitalAsset/LSP7DigitalAssetCore.sol` could be re-entered. It is highly recommended to inherit (ReentrancyGuard.sol)[https://github.com/OpenZeppelin/openzeppelin-contracts/blob/master/contracts/security/ReentrancyGuard.sol] and add `nonReentrant` modifier to them.
8. [fixed] `lsp-smart-contracts-602b79b/contracts/LSP6KeyManager/LSP6KeyManagerCore.sol::_verifyCanSetPermissions()`: consider blocking the `else` case by reverting the transaction to prevent edge cases from bypassing the permission checks.
9. [fixed] `lsp-smart-contracts-602b79b/contracts/LSP6KeyManager/LSP6KeyManagerCore.sol::L395`: consider reverting the transaction if the `allowedERC725YKeysEncoded` data is found corrupted.
10. [fixed] `lsp-smart-contracts-602b79b/contracts/LSP6KeyManager/LSP6KeyManagerCore.sol::L549`: consider reverting the transaction if the `allowedAddresses` data is found corrupted.
11. [fixed] `lsp-smart-contracts-602b79b/contracts/LSP6KeyManager/LSP6KeyManagerCore.sol::L574`: consider reverting the transaction if the `allowedStandards` data is found corrupted.
12. [fixed] `lsp-smart-contracts-602b79b/contracts/LSP6KeyManager/LSP6KeyManagerCore.sol::L600`: consider reverting the transaction if the `allowedFunctions` data is found corrupted.
13. `lsp-smart-contracts-602b79b/contracts/LSP1UniversalReceiver/LSP1UniversalReceiverDelegateUP/LSP1UniversalReceiverDelegateUP.sol::universalReceiverDelegate()`: unused function parameters: `uint256 value` and `bytes memory data`.
14. `lsp-smart-contracts-602b79b/contracts/LSP1UniversalReceiver/LSP1UniversalReceiverDelegateVault/LSP1UniversalReceiverDelegateVault.sol::universalReceiverDelegate()`: unused function parameters: `uint256 value` and `bytes memory data`.
15. `lsp-smart-contracts-602b79b/contracts/Legacy/UniversalReceiverAddressStore.sol::universalReceiverDelegate()`: unused function parameters: `uint256 value` and `bytes memory data`.
16. [fixed] The import of `Initializable` contract has two distinct sources, they are: "@erc725/smart-contracts/contracts/custom/Initializable.sol" and

"@openzeppelin/contracts/proxy/utils/Initializable.sol". Consider removing one of the sources and leaving only one version of `Initializable` contract to avoid the unexpected condition.

17. [fixed] In `lsp-smart-contracts-602b79b/contracts/LSP0ERC725Account/LSP0ERC725AccountCore.sol`, the function `transferOwnership()` seems to be redundent since it was implemented in `ClaimOwnership.sol` with same name and functionality.
18. [fixed] In `lsp-smart-contracts-602b79b/contracts/LSP7DigitalAsset/LSP7DigitalAssetCore.sol`, function name `isOperatorFor` implies the return type should be a boolean . However, the return value is type `uint`. Consider renaming it similar as `authorizedAmount()` to avoid confusion.
19. [fixed] In `lsp-smart-contracts-602b79b/contracts/LSP6KeyManager/LSP6KeyManagerCore.sol`, function `_requirePermissions()` does not return anything. Consider removing `returns (bool)`.
20. [fixed] ERC725 uses `uncheckedIncrement` for iterating through for loops. However, the LSPs repo does not use this. Consider using the same function for the LSPs to save gas.

======2022-09-08 Update======

For `BP-4`, the dev team stated:

```
DELEGATECALL is dangerous by nature and its effects can hardly be anticipated or mitigated. There might be multiple ways to use DELEGATECALL for the same outcome or to override specific parts of the contract storage.

DELEGATECALL will remain disallowed via the KeyManager. Developers who want to use a UP without a Key Manager should be cautious when using DELEGATECALL and ensure the address being called is trusted and will not have dangerous side effects on the contract storage.
```

For `BP-7`, the dev team stated:

```
No reentrancy guard was applied in the internal _mint(...) function. It should be up to the contract implementing LSP7 to add the reentrancy guard depending on the feature they want to allow or not (see also QSP-1 for additional information).
```

For `BP-9` to BP-12` the code is unchanged. The dev team stated:

```
In the current implementation of LSP6KeyManager, for the following data keys:

-    AddressPermissions:AllowedAddresses:<address>
-    AddressPermissions:AllowedFunctions:<address>
-    AddressPermissions:AllowedStandards:<address>
-    AddressPermissions:AllowedERC725YKeys:<address>

A check is currently applied in two scenarios inside the code of LSP6KeyManagerCore.sol

Scenario 1: When the Key Manager reads the UP to retrieve the list of allowed addresses/functions/standards/ERC725YKeys to perform the permissions checks.

When reading the value stored under these data keys, if the underlying bytes stored are corrupted (not a correctly abi-encoded array), then we consider it like if nothing is set under these data keys. This is equivalent to allowing any address, function, etc… according to LSP6. This is the reason why the code returns directly in the related functions.

The reason for this is because if the data under one of these data keys is corrupted, [abi.decode(...)](https://github.com/lukso-network/lsp-smart-contracts/blob/d608479df753087b33897586f2fe92b90252c869/contracts/LSP6KeyManager/LSP6KeyManagerCore.sol#L580) will fail and revert. This would lead a controller address with some incorrectly/corrupted data stored under its allowed key to be stuck. The controller address would not be able to do anything (setData(...) or execute(...)) anymore, as every time it would try to call the Key Manager, it would revert on abi-decode(...). This would make its permission SETDATA or CALL unusable.

Scenario 2: when writing data on the UP via the Key Manager, giving some specific allowed addresses/functions/standards/ERC725YKeys for a controller address (= an address with some permissions) as an input.

A check is made on the values given as input when the payload is setData(...) to verify that no corrupted data will be stored for these data keys. This ensure that the potential issue mentioned in scenario 1 (a controller being stuck) does not occur in the first place.

Therefore the values given as input for setting the AllowedAddresses, AllowedFunctions, AllowedStandards or AllowedERC725YKeys are checked to ensure they are correctly abi-encoded arrays. If they are not, we [revert execution](https://github.com/lukso-network/lsp-smart-contracts/blob/d608479df753087b33897586f2fe92b90252c869/contracts/LSP6KeyManager/LSP6KeyManagerCore.sol#L317-L319).

To conclude, we have these checks in both places (scenario 1 and scenario 2) because these data keys can be set before a Key Manager becomes the owner of an LSP0/Universal Profile. This way, we can catch the potential bug (of a controller address being stuck) by anticipation (scenario 1), and prevent the bug from happening afterwards (scenario 2).
```

For `BP-16`, the dev team stated:

```
The Initializable contract from @erc725/smart-contracts has been removed. Once a new 3.1.3 version of the @erc725/smart-contracts package is released, the dependency will be updated in @lukso/lsp-smart-contracts to fix the error.
```

For `BP-17`, the dev team stated:

```
This function cannot be removed from LSP0ERC725AccountCore.sol because of the inheritance.

This function is also defined in OwnableUnset and needs to be overridden in LSP0. Otherwise, the Solidity compiler does not know which function to refer to (the one from OwnableUnset or from ClaimOwnership) and report the following error:

'Derived contract must override function "transferOwnership". Two or more base classes define function with same name and parameter types'.
```

Test Results

Test Suite Results

All tests have passed.

          should support ClaimOwnership interface
       should deploy an un-initializable CREATE2 contract and get the owner successfully
          should have set key 'SupportedStandards:LSP3UniversalProfile'
    when testing deployed contract
      when using `isValidSignature()` from ERC1271
       should revert when deploying with address(0) as owner
      once the contract was deployed
        when the contract was initialized
     external account adds address
       should revert when deploying with address(0) as owner
      once the contract was deployed
        when the contract was initialized

LSP6KeyManager
       should deploy an initializable CREATE2 contract and get the owner successfully
  when using LSP6KeyManager with constructor
    When Using Proxy contracts
    when deploying the contract
      when initializing the contract
       when the contract was initialized
       should calculate the address of a proxy correctly if it's initializable
     remove address
       should calculate the address of a proxy correctly if it's not initializable
         should verify signature from owner
       should calculate a different address of a proxy if the `salt` changed
       should calculate a different address of a proxy if its initializable or not
       should calculate a different address of a proxy if the `initializeCallData` changed
       should calculate a different address of a proxy if the `baseContract` changed
     should fail if called by a regular address

Test Custom implementation of ERC165Checker
       should revert when deploying a CREATE2 proxy contract with the same `baseContract` and salt
       should revert when sending value while deploying a CREATE2 proxy without `initializeCallData`
           should have registered the ERC165 interface
       should revert when deploying a proxy and sending value to a non payable function in deployCreate2Proxy
       should pass when deploying a proxy and sending value to a payable function in deployCreate2Proxy
         should fail when verifying signature from non-owner
       should revert when deploying a proxy and passing calldata for a non-existing function where fallback function doesn't exist
           should have registered the ERC165 interface
   Calling an EOA
   Calling an EOA
   Calling a contract without a fallback function that doesn't support ERC165
           should have registered the ERC725Y interface
           should have registered the ERC725X interface
   Calling a contract with a fallback function that doesn't support ERC165
       should pass when deploying a proxy and passing calldata for a non-existing function where fallback function exist
   Calling a contract that support ERC165 and ERC725X but doesn't support LSP1

Calculate LSP interfaces
       should deploy an un-initializable CREATE2 proxy contract and get the default owner successfully
           should have registered the ERC165 interface
   LSP0
   LSP1
   LSP1Delegate
           should have registered the LSP8 interface
   LSP6
   LSP7
   LSP8
   LSP9
   IClaimOwnership

Calculate ERC interfaces
           should have registered the ERC725Y interface
   ERC20
   ERC223
   ERC721
   ERC721Metadata
   ERC777
   ERC1155
   ERC1271

Key Manager gas cost interactions
  when using LSP6KeyManager with constructor
    after deploying the contract
         should return failValue when the owner doesn't support ERC1271
```

```
        when interacting with the ERC725Y storage
             should have set expected entries with ERC725Y.setData
      when testing deployed contract
        when setting data on ERC725Y storage
         should deploy an initializable CREATE2 proxy contract and get the owner successfully

Code Coverage

For code coverage the current test code managed to achieve 88.1% coverage for `ERC725Alliance/ERC725` and 82.23% coverage for `lukso-network/lsp-smart-contracts`. We recommend increasing the branch coverage to 90% before the project go live, in order to avoid hidden functional bugs that might not be easy to spot during the development phase.

File Signatures

The following are the SHA-256 hashes of the reviewed files. A file with a different SHA-256 hash has been modified, intentionally or otherwise, after the security review. You are cautioned that a different SHA-256 hash could be (but is not necessarily) an indication of a changed condition or potential vulnerability that was not within the scope of the review.

- 2022-08-10 - Initial report
- 2022-09-08 - Final report

About Quantstamp

Quantstamp is a Y Combinator-backed company that helps to secure blockchain platforms at scale using computer-aided reasoning tools, with a mission to help boost the adoption of this exponentially growing technology.

With over 1000 Google scholar citations and numerous published papers, Quantstamp's team has decades of combined experience in formal verification, static analysis, and software verification. Quantstamp has also developed a protocol to help smart contract developers and projects worldwide to perform cost-effective smart contract security scans.

To date, Quantstamp has protected $5B in digital asset risk from hackers and assisted dozens of blockchain projects globally through its white glove security assessment services. As an evangelist of the blockchain ecosystem, Quantstamp assists core infrastructure projects and leading community initiatives such as the Ethereum Community Fund to expedite the adoption of blockchain technology.

Quantstamp's collaborations with leading academic institutions such as the National University of Singapore and MIT (Massachusetts Institute of Technology) reflect our commitment to research, development, and enabling world-class blockchain security.
